

Computer Vision Project Proposal

Project Group

- Johannes Bertsch
- Felix Wedén Wærstad
- Ong Wei En

Scope of the Project

The goal of the project is to count the number of people who have walked through a door into a room. This can be used to monitor how many people are within a room and count how many people have entered and left. Applications of this project could be for crowd control or monitoring the occupancy of a vehicle in public transport.

A camera will be placed above the door frame pointing down, to capture the persons walking in and out.

Breakdown of task:

- Detecting people (we need to select a model which can identify people and track them)
- How to count them after detecting
- Other things: (If there is time)
 - Detect and count other things entering/leaving the room, like wheelchairs, bicycles, ...

Equipment

A web camera and a computer.
